B. Tyura Tan.

- 1. Size of hole 860' x 550' launch Area A Size of launch table - 130' x 159' Size of tower - 17' diameter, 64' in height
- 2. Launch Area B has procisely the same security as launch area A:
 - a. Double foncing.
 - b. Light poles between outer and inner fences.
 - e. Guard towers.
- 3. Water flooding of Launch Area A was discounted as being accomplished through the large "pipe" shown on drawings. This "pipe" is some 10' in diameter and has a free unsupported span of over 200'. This pipe leads to a low earthsovered bunker (questioned as water storage) thought possibly to be for personnel, possibly the control bunkers. The so-called water "pipe" was pointed out as being very similar to some of our own cable galleries, including personnel access way (walk way).
- 4. You have referred to asure at "I as being located in a circular dish. The circular appearance is due to a circular graded area.
- The installation at Uka on the Kanchatka Feninsula, identical to the Agura at TT, does not have the circular graded area. In addition to the Amura at Uka, there is a possible one under construction, 35 MM North of Klyuchi.

C. Eapustin Tar.

- 1. The consultants emphasised the fact that at KY each main launch area, eg, the Moscow-type SAM site, the short-range 76 to 160 KM area, the 300 MM, 650 MM, 960 MM Area, etc., has its own instrumentation and apparently can schedule firings independently. This is not the case at Canaveral.
- 2. Sumber of Launch Peds. Hime launch areas which include: 10 permanent short-and intermediate-range ballistic missile pads

- 72 pads in the Mescow-type SAM area 8-10 troop tending ballistic launch positions At least 2 agro-dynamic launch positions
- D. New airfield E. of Hurmanak you have referred to the four areas at extremity of the long taxingy as underground entrances. This area appears on the far oblique and the four areas appear to be hardstands.

25X1
